## Revolutionizing security *Smart handles for companies and private individuals*

Connected handles are now available for your house! These handles are very diverse but the objective stays the same: enforce security for people not allowed to enter a room. The handles can be unlocked via an app, via facial recognition, via fingerprint recognition, via voice recognition... They smartly remember the time the door has been opened but also by who. These handles can also be unlocked from distance enabling parents to open the door to children or to external members of the family when needed.

They can be implemented to open room doors but also cupboard room. If it can prevent children to open cupboards containing dangerous products the main interest is for companies. Actually they can be coupled with smart cupboards. Starting from the moment the door is opened, the cupboard records all the files taken and by who. It is a way to ensure data security in companies.

As data security is a major concern for companies now. Even if fewer and fewer documents are printed nowadays, it is sometimes necessary to print some and smart cupboards can be the solution to enforce security.

Smart handles are part of the smart changes that houses and companies are going to implement to easily secure their property.
