

CLIMEON

Be the n.1 Climate solver

Climate change represents one of the greatest challenges our world is currently facing. Several interventions are required in different areas of the economy, including the energy sector. Progress has been made on the development of clean energy thanks to massive investments in renewable sources such as wind and solar power. However, despite their eco-friendly characteristics, the abovementioned energy sources are still far from being fully integrated into the current energy mix due to intermittency and weather issues.

In order to tackle such problems, Climeon's unique offer aims at providing a system that turns heat into clean electricity 24/7, unaffected by weather conditions. In fact, the patented Climeon Heat Power exploits the temperature difference between hot and cold water or gas, and eventually converts low temperature waste heat or geothermal heat into profitable clean electricity.

Thanks to this innovative equipment, Climeon has been able to revolutionise the renewable energy sector and to establish an attractive product which is at the same time environmental- and cost-efficient. Most of the firm's customer base is represented by big players from highly-polluting industries such as maritime (e.g. Viking Cruise lines) and construction sectors. Moreover, they partner with national governments around the world (e.g. Iceland, Japan) in order to scale up the geothermal power business and help them comply with the new environmental requirements set within the Paris Agreement.
